Supported Storage Types

Your service provider can configure Acronis Software-Defined Infrastructure to keep your data in three storage types:

- S3 object storage for storing an unlimited number of objects (files).
- iSCSI block storage for virtualization, databases, and other needs.
- NFS shares for storing an unlimited number of files via a distributed filesystem.

The following sections describe the ways to access data in Acronis Software-Defined Infrastructure in detail.
CHAPTER 2

Accessing S3 Buckets

To access S3 buckets, get the following information (credentials) from your system administrator:

- user panel IP address,
- DNS name of the S3 endpoint,
- access key ID,
- secret access key.

Acronis Software-Defined Infrastructure allows you to access your S3 data in several ways:

- via the Acronis Software-Defined Infrastructure user panel;
- via a third-party S3 application like Cyberduck, Mountain Duck, Backup Exec, etc.

2.1 Managing Buckets via the Acronis Software-Defined Infrastructure User Panel

This section describes how to manage buckets and their contents from the Acronis Software-Defined Infrastructure user panel.

2.1.1 Logging in to User Panel

To log in to the Acronis Software-Defined Infrastructure user panel, do the following:

1. On any computer with access to the web interface, in a web browser visit
Chapter 2. Accessing S3 Buckets

http://<user_panel_IP_address>:8888/s3/.

Log In

ENDPOINT
s3.example.com

Use secure transfer (SSL)

ACCESS KEY ID
d9fde6a530879f59f88f8

SECRET ACCESS KEY

LOG IN

2. On the login screen, enter your credentials in the corresponding fields and click LOG IN.

Once you log in to the web interface, you will see the Buckets screen with the list of your buckets. From here, you can manage buckets as well as folders and files stored inside the buckets.

To log out, click the user icon in the upper right corner of any screen and click Log out.

2.1.2 Adding, Deleting, and Listing S3 Buckets

On the Buckets screen:

• To add a new bucket, click Add bucket, specify a name, and click Add.

Add bucket

Bucket name
bucket1

Add Cancel

Use bucket names that comply with DNS naming conventions. For more information on bucket naming, see S3 Bucket and Key Naming Policies (page 13).

• To delete a bucket, select it and click Delete.
• To list bucket contents, click a bucket name in the list.

2.1.2.1 Listing S3 Bucket Contents in a Browser

You can list bucket contents with a web browser. To do this, visit the URL that consists of the external DNS name for the S3 endpoint that you specified when creating the S3 cluster and the bucket name. For example, mys3storage.example.com/mybucket.

**Note:** You can also copy the link to bucket contents by right-clicking it in CyberDuck, and then selecting Copy URL.

2.1.3 Creating, Deleting, and Listing Folders

On the bucket contents screen:

• To create a folder, click **New folder**, specify folder name in the **New folder** window, and click **Add**.

• To delete a folder, select it and click **Delete**.

• To list folder contents, click a folder name.

2.1.4 Uploading and Downloading Files

On the bucket or folder contents screen:

• To upload files to S3, click **Upload** and choose files to upload.
Chapter 2. Accessing S3 Buckets

2.1.5 Obtaining and Validating File Certificates

Acronis Software-Defined Infrastructure offers integration with the Acronis Notary service to leverage blockchain notarization and ensure the immutability of data saved in S3 buckets.

To certify files stored in your buckets, ask your system administrator to enable the Acronis Notary service for the buckets.

After that, you will be able to do the following:

- To get a notarization certificate for a file, select it and click **Get Certificate**.
- To check the validity of a file's certificate, click **Verify**.

2.2 Accessing S3 Storage with CyberDuck

To access Acronis Software-Defined Infrastructure with CyberDuck, do the following:

1. In CyberDuck, click **Open Connection**.
2. Specify your credentials:
   - The DNS name of the S3 endpoint.
   - The **Access Key ID** and, the **Password** field, the secret access key of an object storage user.
Chapter 2. Accessing S3 Buckets

By default, the connection is established over HTTPS. To use CyberDuck over HTTP, you must install a special S3 profile.

3. Once the connection is established, click **File > New Folder** to create a bucket.

![Create new folder dialog]

4. Specify a name for the new bucket, and then click **Create**. Use bucket names that comply with DNS naming conventions. For more information on bucket naming, see *S3 Bucket and Key Naming Policies* (page 13).

The new bucket will appear in CyberDuck. You can manage it and its contents.

### 2.2.1 Managing S3 Bucket Versions

Versioning is a way of keeping multiple variants of an object in the same bucket. You can use versioning to preserve, retrieve, and restore every version of every object stored in your S3 bucket. With versioning, you can easily recover from both unintended user actions and application failures. For more information about bucket versioning, refer to the Amazon documentation.

Bucket versioning is turned off by default. In CyberDuck, you can enable it in bucket properties. For example:
2.3 Mounting S3 Storage with Mountain Duck

Mountain Duck enables you to mount and access Acronis Software-Defined Infrastructure S3 storage as a regular disk drive. Do the following:

1. If your service provider has provided you with an SSL certificate, install it.

2. In Mountain Duck, click **New Bookmark**.

3. In the properties window, select **Amazon S3** profile from the first drop-down list and specify the
following parameters:

- **Nickname** of the disk drive,
- endpoint DNS name in the **Server** field,
- access key ID in the **Username** field;

and click **Connect**.

4. In the login window, specify **Secret Access Key** and click **Login**.
Mountain Duck will mount the S3 storage as a disk drive. On the disk, you can manage buckets and store files in them.

### 2.3.1 Creating S3 Buckets on Mounted S3 Storage

Windows and Mac OS X, operating systems supported by MountainDuck, treat buckets as folders in case the S3 storage is mounted as a disk drive. In both operating systems, the default folder name contains spaces. This violates bucket naming conventions (see S3 Bucket and Key Naming Policies (page 13)), therefore you cannot create a new bucket directly on the mounted S3 storage. To create a bucket on a mounted S3 storage, create a folder with a name complying with DNS naming conventions elsewhere and copy it to the root of the mounted S3 storage.

### 2.4 Configuring Backup Exec to Keep Backups in S3 Storage

To store Backup Exec backups in S3 storage, do the following:

1. Create a bucket to store backups either using the Acronis Software-Defined Infrastructure user panel or another application.

2. Install Backup Exec. During installation, make sure to select all the components of Backup Exec and check all the updates.

3. Run CLILauncher located in C:\Program Files\Veritas\Backup Exec.

4. In the Backup Exec command-line prompt, run the following command:

```bash
# New-BECloudInstance -Name "cloudinstance" -Provider "cloudian" 
-ServiceHost "<S3_DNS_name>" -SslMode "Disabled" -UrlStyle "Path"
```
5. In Backup Exec, click **Configure Cloud Storage** on the **Storage** tab.

6. In the **Configure storage...** window, specify a name for the S3 storage and click **NEXT**.

7. Select the **S3** device and click **NEXT**.
8. Select cloudinstance [cloudian] from the **Cloud storage** drop-down list.

9. Click **Add/Edit** next to the **Logon account** drop-down list.

10. In the **Logon Account Selection** window, click **Add**.
11. In the **Account credentials** section, specify your credentials:

11.1. S3 access key ID in the **User name** field.

11.2. S3 secure access key in the **Password** field and confirm it.

11.3. The username of your account in the **Account name** field.

12. Clear all the checkboxes and click **OK**.

13. Back in the **Logon Account Selection** window, make sure the newly added user account is selected and
14. Back in the **Configure storage...** window, click **NEXT**.

15. Select a bucket and click **NEXT** twice.

16. On the summary screen, click **Finish**, **OK**, and **Yes**.

Once the Backup Exec services are restarted, the S3 storage will appear in the list on the **Storage** tab. Now you can create backup jobs and specify the S3 storage as destination.

### 2.5 S3 Bucket and Key Naming Policies

It is recommended to use bucket names that comply with DNS naming conventions:

- can be from 3 to 63 characters long,
- must start and end with a lowercase letter or number,
- can contain lowercase letters, numbers, periods (.), hyphens (-), and underscores (_),
- can be a series of valid name parts (described previously) separated by periods.

An object key can be a string of any UTF-8 encoded characters up to 1024 bytes long.
CHAPTER 3

Accessing iSCSI Targets

This section describes ways to attach iSCSI targets to operating systems and third-party virtualization solutions that support the explicit ALUA mode.

3.1 Accessing iSCSI Targets from VMware ESXi

Before using Acronis Software-Defined Infrastructure volumes with VMware ESXi, you need to configure it to properly work with ALUA Active/Passive storage arrays. The default path selection policy (PSP) for ALUA devices is `VMW_PSP_MRU` that never falls back to standby paths. To use ALUA Active/Passive storage arrays, you need to set the default PSP to `VMW_PSP_FIXED`. For example, on VMware ESXi 6.5:

- to set the default PSP for all devices, run

```
# esxcli storage nmp satp set -b --satp=VMW_SATP_ALUA --default-psp=VMW_PSP_FIXED
```

- to set the PSP for a specific device, run

```
# esxcli storage nmp device set --device=<device_name> --psp=VMW_PSP_FIXED
```

Now you can proceed to create datastores from Acronis Software-Defined Infrastructure volumes exported via iSCSI. Log in to the VMware ESXi web panel and do the following:

1. In the Navigator, go to the **Storage > Adapters** tab and click **Configure iSCSI**.
2. In the **Configure iSCSI** window, click **Add static target** in the Static targets section, fill out target IQNs, IP addresses, and ports. Click **Save configuration**.

3. Proceed to the **Devices** tab and click **Refresh**. The newly added disk will appear in the list of devices.

4. Select the disk and click **New datastore**. In the wizard that appears, enter a name for the datastore and select partitioning options. Click **Finish** to actually partition the disk.

   **Warning:** Partitioning the disk will erase all data from it.

The ready-to-use disk will appear in the list of datastores. You can now view its contents it with the datastore browser and provision it to VMs.
**Note:** If your ESXi host loses connectivity to VMFS3 or VMFS5 datastores, follow the instructions in KB article #2113956.

CHAPTER 4

Accessing NFS Shares

This section describes ways to mount Acronis Software-Defined Infrastructure NFS shares on Linux and MacOS.

Note: Acronis Software-Defined Infrastructure currently does not support the Windows built-in NFS client.

4.1 Mounting NFS Exports on Linux

You can mount an NFS export created in Acronis Software-Defined Infrastructure like any other directory exported via NFS. You will need the share IP address (or hostname) and the volume identifier.

In console, run a command like the following:

```
# mount -t nfs -o vers=4.0 192.168.0.51:/<share_name>/ /mnt/nfs
```

where:

- `-o vers=4.0` is the NFS version to use.

  To use pNFS, change `-o vers=4.0` to `-o vers=4.1`. In all other cases, make sure to always specify NFS version 4.0 or newer.

- `192.168.0.51` is the share IP address. You can also use the share hostname.

- `/<share_name>/` is the root export path. For user exports, specify their full path, for example: `/<share_name>/export1`.

- `/mnt/nfs` is an existing local directory to mount the export to.
4.2 Mounting NFS Exports on MacOS

You can mount an NFS export created in Acronis Software-Defined Infrastructure like any other directory exported via NFS. You will need the share IP address (or hostname) and the volume identifier.

You can use the command-line prompt or Finder:

• In console, run a command like the following:

```bash
# mount -t nfs -o vers=4.0 192.168.0.51:/<share_name>/ /mnt/nfs
```

where:

- `-o vers=4.0` is the NFS version to use.
- `192.168.0.51` is the share IP address. You can also use the share hostname.
- `/<share_name>/` is the root export path. For user exports, specify their full path, for example: `/<share_name>/export1`.
- `/mnt/nfs` is an existing local directory to mount the export to.

• In Finder, do the following:

1. Set the NFS version to 4.0. To do this, add the `nfs.client.mount.options = vers=4.0` line to the `/etc/nfs.conf` file.

2. In the **Finder > Go > Connect to server** window, specify `nfs://192.168.0.51:/<share_name>/`

   where:

   - `192.168.0.51` is the share IP address. You can also use the share hostname.
   - `/<share_name>/` is the root export path. For user exports, specify their full path, for example: `/<share_name>/export1`.

3. Click **Connect**.

   The Finder will mount the export to `/Volumes/<share_name>/`.
